

THE CLIP SYSTEM

The CLIP system was designed in a way to lower cost of installation, increase field productivity, adding value to the installation process. When installing anything into the envelope of the building you have to be careful about penetrations, our system is designed to minimize penetrations while maximizing the strength of the assembly.

The unique design of the CLIP increases the strength of the fabricated panel. Driving rain and building pressures are properly mitigated through this design. Rain-Screen and Building Envelope science requires that all components of rain-screen assemblies work together in unison.

Our design incorporates this technology from the clips' tolerance and spacing to the type of metal and ratios of alloy's. Our solution provides for a safe, affordable more aesthetically pleasing rain-screen assembly.
